Sep 26, 2020 11C: Microchip Technology My development environment is Intel XDK. Category:Ford softwareAn examination of the pattern of maternal deprivation and its relationship with the attention deficit hyperactivity disorder. The current study examined the effect of daycare attendance and birth order on maternal behavior with the expectation that daycare attendance would predict the level of attention deficit hyperactivity disorder (ADHD). Mothers were included if they had a well baby with no other medical or psychiatric conditions and those mothers were classified into three groups, (1) early daycare (0-2 years), (2) intermediate daycare (3-6 years), and (3) late daycare (7-18 years). The data were collected when the child was 5 years old. The results indicated that daycare attendance was only related to the mothers that they attended early daycare. It was found that the mother's socioeconomic status was a predictor of daycare attendance, with the probability of daycare attendance increasing the lower the mothers' income. Early daycare attendance was related to the mother's level of stress, with daycare attendance being associated with higher stress levels. In regards to the relationship between birth order and attention and activity deficit hyperactivity disorder, it was found that the probability of a higher birth order was positively related to the probability of ADHD
